

DevSecOps

Course Summary

The DevSecOps training course is designed to demonstrate security practices earlier in the life cycle of application development by minimizing vulnerabilities and bridging security and business objectives.

The course begins with a discussion of threats and threat detection. Next, it explores penetration testing and the tools used for penetration testing. The course concludes with a discussion on monitoring and automating security ops.

Purpose	Learn the philosophy, models, goals, practices and tools being used to move to a DevSecOps culture.
Audience	Developers and developer teams looking to incorporate the philosophy, models, goals, practices and tools of DevSecOps into their development workflows.
Role	Software Developer - System Administrator
Skill Level	Introduction
Style	Learning Spikes - Workshops
Duration	2 Days
Related Technologies	Cloud Computing Training Azure

Productivity Objectives

- Define DevSecOps - what it is, it's goals and how to avoid failures

- Discuss the DevSecOps lifecycle
- Identify tools and programs that can be used to implement and work within a DevSecOps practice

What You'll Learn:

In the DevSecOps training course, you'll learn:

- What is DevSecOps?
 - History
 - Business Impact
- Thinking Like a Hacker
 - Become a white hat
- Application Threats vs Infrastructure Threats
 - Implications in the Cloud
- Threat Maps
 - Create an attack map
- Detecting Threats Upstream
 - OWASP
 - The OWASP top 10
- Penetration Testing
 - What is it?
 - How to perform a test?
- PEN Testing Tools
 - Metasploit
 - ZAP
- Monitoring Using Azure Monitoring
- Automation
 - Automation in the Dev Pipeline
 - Hooking prevention into the Dev Pipeline
 - Integrating PEN testing tools into a Jenkins pipeline
